

**MATH 100 – NOTES 19**  
**THE SHAPE OF THE GRAPH**

1. TOOLS

Let  $f$  be differentiable as needed on  $(a, b)$ .

**Fact** (First derivative). (1) If  $f'(x) > 0$  for all  $x \in (a, b)$  then  $f$  is strictly increasing there.  
(2) If  $f'(x) < 0$  for all  $x \in (a, b)$  then  $f$  is strictly decreasing there.

Every change involves either a *critical point* ( $f'$  vanishes) or a *singularity* ( $f'$  undefined).

**Fact** (Second derivative). (1) If  $f''(x) > 0$  for all  $x \in (a, b)$  then  $f$  is concave up there.  
(2) If  $f''(x) < 0$  for all  $x \in (a, b)$  then  $f$  is concave down there.

**Definition 1.** A change in concavity is called an *inflection point*.

**Theorem.** (Tests for minima and maxima) Let  $x_0 \in (a, b)$  be a critical or singular number for  $f$ , and suppose  $f$  is continuous at  $x_0$ , differentiable near it.

- (1) Either of the following is sufficient to show that  $f$  has a local minimum at  $x_0$ :
  - (a)  $f''(x_0) > 0$  or;
  - (b)  $f'(x)$  is negative to the left of  $x_0$ , positive to its right.
- (2) Either of the following shows that  $f$  has a local maximum at  $x_0$ :
  - (a)  $f''(x_0) < 0$  or;
  - (b)  $f'(x)$  is positive to the left of  $x_0$ , negative to its right.

**Curve sketching protocol.** Given a function  $f$ .

0th derivative stuff:

- (a) The domain and the domain of continuity.
- (b) Domains where  $f > 0$ ,  $f < 0$ .
- (c) Anchor points:  $x$ - and  $y$ -intercepts.
- (d) Horizontal and vertical asymptotes.

1st derivative stuff: using  $f'(x)$  determine

- (a) Domains where  $f' > 0$ ,  $f' < 0$
- (b) Critical and singular numbers.

2nd derivative stuff:

- (a) Domains where  $f'' > 0$ ,  $f'' < 0$
- (b) Points where  $f''(x) = 0$ , inflection points.

## 2. EXAMPLES

2.1.  $f(x) = \frac{x^2-9}{x^2+3}$ .

- $f'(x) \stackrel{\text{quot}}{=} \frac{2x(x^2+3)-2x(x^2-9)}{(x^2+3)^2} = \frac{24x}{(x^2+3)^2}$ .
- $f''(x) = 24 \frac{1}{(x^2+3)^2} - 24 \frac{x \cdot 2x}{(x^2+3)^3} = 24 \frac{(x^3+3)-4x^2}{(x^2+3)^3} = 72 \frac{1-x^2}{(x^2+3)^3}$ .

Thus

- (1)  $f$  defined on  $\mathbb{R}$ , cts everywhere (defined by formula; denominator everywhere nonzero). Moreover
  - (a)  $f(0) = -3$ ,  $f(x) = \frac{(x-3)(x+3)}{x^2+3}$  so vanishes at  $x = \pm 3$ , negative between them, positive otherwise.
  - (b)  $\lim_{x \rightarrow \pm\infty} f(x) = \lim_{x \rightarrow \pm\infty} \frac{1-9/x^2}{1+3/x^2} = 1$ .
- (2)  $f'(x)$  is negative for  $x < 0$ , zero at  $x = 0$ , positive at  $x > 0$  (hence at the critical number  $x = 0$  we have a local minimum)
- (3)  $f''(x)$  has the same sign as  $(1-x)^2 = (1-x)(1+x)$  so it is negative if  $x < -1$  or  $x > 1$ , positive if  $-1 < x < +1$  and zero at  $x = \pm 1$  which are therefore inflection points.

The "special" points were:  $-3, -1, 0, 1, 3$  so we break up the domain of  $f$  at those points:

$x$	$(-\infty, -3)$	$-3$	$(-3, -1)$	$-1$	$(-1, 0)$	$0$	$(0, 1)$	$1$	$(1, 3)$	$3$	$(3, \infty)$
$f$	+	0	-	-2	-	-9	-	-2	-	0	+
$f'$	+	+	+	+	+	0	+	+	+	+	+
$f''$	-	-	-	0	-	-	-	0	-	-	-

2.2.  $f(x) = x^{2/3}(x-1)$ .

- $f'(x) = \frac{2}{3}x^{-1/3}(x-1) + x^{2/3} = \frac{2(x-1)+3x}{3x^{1/3}} = \frac{5x-2}{3x^{1/3}}$
- $f''(x) = \frac{5}{3x^{1/3}} - \frac{5x-2}{9x^{4/3}} = \frac{15x-(5x-2)}{9x^{4/3}} = \frac{10x+2}{9x^{4/3}}$

Thus (note:  $x^{2/3}$  and  $x^{4/3}$  are always non-negative;  $x^{1/3}$  has the same sign as  $x$ )

- (1)  $f$  defined on  $\mathbb{R}$  ( $x^{1/3}$  defined everywhere), continuous there (defined by formula).
  - (a)  $f(0) = 0$ ,  $f(1) = 0$  and  $f$  is positive if  $x < 1$  negative if  $x > 1$  ( $x^{2/3} \geq 0$  for all  $x$ )
  - (b)  $\lim_{x \rightarrow \pm\infty} |f(x)| = \infty$  so no horizontal asymptotes.
- (2) The critical numbers are 0 ( $f'$  undefined) and  $\frac{2}{5}$  ( $f' = 0$ ). Otherwise  $f' > 0$  if  $x < 0$ ,  $f' < 0$  if  $0 < x < \frac{2}{5}$  and  $f' > 0$  if  $x > \frac{2}{5}$ .
- (3) . Thus  $f''$  is undefined at 0, vanishes at  $-\frac{1}{5}$ , and is negtive if  $x < -\frac{1}{5}$ , positive if  $-\frac{1}{5} < x < 0$  or  $x > 0$ , so only  $-\frac{1}{5}$  is an inflection point.

Summary table:

$x$	$(-\infty, -\frac{1}{5})$	$-\frac{1}{5}$	$(-\frac{1}{5}, 0)$	$0$	$(0, \frac{2}{5})$	$\frac{2}{5}$	$(\frac{2}{5}, 1)$	$1$	$(1, \infty)$
$f$	-	$-\frac{4}{5^{5/3}}$	-	0	-	$-\frac{3 \cdot 4^{1/3}}{5^{5 \cdot 3}}$	-	0	+
$f'$	+	+	+	undef	-	0	+	+	+
$f''$	-	0	+	undef	+	+	+	+	+
