Outline
Week 12: Vector differential equations

## Course Notes: 6.3

Goals: be able to solve a linear system of differential equations; find characteristics of electrical networks involving inductors and capacitors using methods learned this term.

## Currs Notese 6.3: Systems of Linear Differential Equations

Differential Equations

We're going to doing this in a linear-systems context soon.

$$
y^{\prime}(t)=\lambda y(t), \quad \lambda \text { constant }
$$

Solutions: $y(t)=C e^{\lambda t}$, constant $C$

## Course Notes 6.3: Systems of Linear Differential Equations

Differential Equations
Example: a radioactive substance decays at a rate of $2 \%$ of its
mass every year.

Course Notes 6.3: Systems of Linear Differential Equations
0000000000000000000000
Systems of Linear Differential Equations

$$
\begin{aligned}
& y_{1}^{\prime}(t)=\boldsymbol{a} y_{1}(t)+\boldsymbol{b} y_{2}(t) \\
& y_{2}^{\prime}(t)=\boldsymbol{c} y_{1}(t)+\boldsymbol{d} y_{2}(t)
\end{aligned}
$$

$$
\mathbf{y}^{\prime}:=\left[\begin{array}{l}
y_{1}^{\prime}(t) \\
y_{2}^{\prime}(t)
\end{array}\right] \quad A=\left[\begin{array}{ll}
a & b \\
c & d
\end{array}\right] \quad \mathbf{y}:=\left[\begin{array}{l}
y_{1}(t) \\
y_{2}(t)
\end{array}\right]
$$

$$
y^{\prime}=A y
$$

## Course Notes 6.3: Systems of Linear Differential Equations

Guessing Solutions: Eigenvectors

Differential Equation:

$$
\mathrm{y}^{\prime}=A \mathrm{y}
$$

Let's take a guess from our previous examples: what if

$$
\mathbf{y}=e^{\lambda t} \mathbf{x}
$$

for some constant $\lambda$ and some constant vector $\mathbf{x}$ ?

Adding Solutions

Suppose $\mathbf{y}_{1}$ and $\mathbf{y}_{2}$ are both solutions to the system of differential equations $A \mathbf{y}=\mathbf{y}^{\prime}$.

oooono
Solutions to Systems of Linear Differential Equations

## Notes

Theorem
Suppose $A$ is an $n$-by- $n$ matrix with eigenvalues and vectors $\lambda_{1}, \lambda_{2}, \ldots, \lambda_{k}$ and $\mathbf{x}_{1}, \mathbf{x}_{2}, \ldots, \mathbf{x}_{k}$. Then for any choice of constants $c_{1}, c_{2}, \ldots, c_{k}$,

$$
\mathbf{y}(t)=c_{1} e^{\lambda_{1} t} \mathbf{x}_{1}+c_{2} e^{\lambda_{2} t} \mathbf{x}_{2}+\cdots+c_{k} e^{\lambda_{k} t} \mathbf{x}_{k}
$$

is a solution to the equation $\mathbf{y}^{\prime}=A \mathbf{y}$
General Question: Is there a solution to $\mathbf{y}^{\prime}=A \mathbf{y}$ that also has $\mathbf{y}(0)=\mathbf{y}_{0}$, for some constant vector $\mathbf{y}_{0}$ ?

## Course Notes 6.3: Systems of Linear Differential Equations <br> Example

Find the solution to the system of linear differential equations

$$
\begin{aligned}
y_{1}^{\prime}(t) & =y_{1}(t)+4 y_{2}(t)+5 y_{3}(t) \\
y_{2}^{\prime}(t) & = \\
y_{3}(t) & =
\end{aligned}
$$

with initial condition

$$
\mathbf{y}(0)=\left[\begin{array}{c}
0 \\
11 \\
2
\end{array}\right]
$$

## Course Notes 6.3: Systems of Linear Differential Equations 00000000000000000000000

The form of the solution will be

$$
\mathbf{y}(t)=c_{1} e^{\lambda_{1} t} \mathbf{x}_{1}+c_{2} e^{\lambda_{2} t} \mathbf{x}_{2}+\cdots+c_{k} e^{\lambda_{k} t} \mathbf{x}_{k}
$$

That is:

$$
\mathbf{y}(t)=c_{1} e^{t}\left[\begin{array}{l}
1 \\
0 \\
0
\end{array}\right]+c_{2} e^{2 t}\left[\begin{array}{l}
4 \\
1 \\
0
\end{array}\right]+c_{3} e^{3 t}\left[\begin{array}{c}
29 \\
12 \\
2
\end{array}\right]
$$

To find the constants $c_{1}, c_{2}, c_{3}$ we solve:
$\left[\begin{array}{c}0 \\ 11 \\ 2\end{array}\right]=c_{1}\left[\begin{array}{l}1 \\ 0 \\ 0\end{array}\right]+c_{2}\left[\begin{array}{l}4 \\ 1 \\ 0\end{array}\right]+c_{3}\left[\begin{array}{c}29 \\ 12 \\ 2\end{array}\right]$
So $c_{1}=-25, c_{2}=-1$, and $c_{3}=1$. Our solution is:

$$
\mathbf{y}(t)=-25 e^{t}\left[\begin{array}{l}
1 \\
0 \\
0
\end{array}\right]-1 e^{2 t}\left[\begin{array}{l}
4 \\
1 \\
0
\end{array}\right]+e^{3 t}\left[\begin{array}{c}
29 \\
12 \\
2
\end{array}\right]=\left[\begin{array}{c}
-25 e^{t}-4 e^{2 t}+29 e^{3 t} \\
-e^{2 t}+12 e^{3 t} \\
2 e^{3 t}
\end{array}\right]
$$

$\qquad$

Find the solution to the system of linear differential equations

$$
\begin{aligned}
& y_{1}^{\prime}(t)=y_{1}(t) \\
& y_{2}^{\prime}(t)=3 y_{1}(t)-y_{2}(t)
\end{aligned}
$$

with initial condition

$$
\mathbf{y}(0)=\left[\begin{array}{l}
4 \\
1
\end{array}\right]
$$

## Course Notes 6.3: Systems of Linear Differential Equations

The form of the solution will be:

$$
\mathbf{y}(t)=c_{1} e^{\lambda_{1} t} \mathbf{x}_{1}+c_{2} e^{\lambda_{2} t} \mathbf{x}_{2}+\cdots+c_{k} e^{\lambda_{k} t} \mathbf{x}_{k}
$$

That is:

$$
\mathbf{y}(t)=c_{1} e^{t}\left[\begin{array}{l}
2 \\
3
\end{array}\right]+c_{2} e^{-t}\left[\begin{array}{l}
0 \\
1
\end{array}\right]
$$

To find the constants $c_{1}, c_{2}$ we solve:

$$
\left[\begin{array}{l}
4 \\
1
\end{array}\right]=c_{1}\left[\begin{array}{l}
2 \\
3
\end{array}\right]+c_{2}\left[\begin{array}{l}
0 \\
1
\end{array}\right]
$$

So $c_{1}=2, c_{2}=-5$. Our solution is:

$$
\mathbf{y}(t)=2 e^{t}\left[\begin{array}{l}
2 \\
3
\end{array}\right]-5 e^{-t}\left[\begin{array}{l}
0 \\
1
\end{array}\right]=\left[\begin{array}{c}
4 e^{t} \\
6 e^{t}-5 e^{-t}
\end{array}\right]
$$

Course Notes 6.3: Systems of Linear Differential Equations
oonoonoo000000000000000
Quick Recap

\[\)| $y_{1}^{\prime}(t)$ | $=y_{1}(t)+2 y_{2}(t)$ |
| :--- | :--- | :--- |
| $y_{2}^{\prime}(t)$ | $=y_{1}(t)+2 y_{2}(t)$ |

\]

1. Create the matrix of coefficients
2. Find eigenvalues and corresponding eigenvectors
3. The general solution is $\mathbf{y}=c_{1} e^{\lambda_{1} t} \mathbf{x}_{\mathbf{1}}+c_{2} e^{\lambda_{2} t} \mathbf{x}_{\mathbf{2}}+\cdots c_{n} e^{\lambda_{n} t} \mathbf{x}_{\mathbf{n}}$
4. Find the values of $c_{i}$ that fit the initial conditions. That gives you the particular solution.

## Course Notes 6.3: Systems of Linear Differential Equations

Complex Eigenvalues

$$
\mathbf{y}^{\prime}(t)=\left[\begin{array}{cc}
0 & -2 \\
8 & 0
\end{array}\right] \mathbf{y}(t) \quad \mathbf{y}(0)=\left[\begin{array}{c}
-4 \\
12
\end{array}\right]
$$

Eigenvalues: $\lambda_{1}=4 i, \lambda_{2}=-4 i$
Eigenvectors: $\mathbf{x}_{1}=\left[\begin{array}{l}i \\ 2\end{array}\right], \mathbf{x}_{2}=\left[\begin{array}{c}-i \\ 2\end{array}\right]$

General solution: $\mathbf{y}(t)=c_{1} e^{4 i t} \mathbf{x}_{1}+c_{2} e^{-4 i t} \mathbf{x}_{2}$
for some constants $c_{1}$ and $c_{2}$.

Particular solution: $\mathbf{y}(t)=(3+2 i) e^{4 i t} \mathbf{x}_{1}+(3-2 i) e^{-4 i t} \mathbf{x}_{2}$

```
y(t)=(3+2i)\mp@subsup{e}{}{4it}\mp@subsup{\mathbf{x}}{1}{}+(3-2i)\mp@subsup{e}{}{-4it}\mp@subsup{\mathbf{x}}{2}{}
    =(3+2i)[cos(4t)+i\operatorname{sin}(4t)]\mp@subsup{\mathbf{x}}{1}{}+(3-2i)[\operatorname{cos}(-4t)+i\operatorname{sin}(-4t)]\mp@subsup{\mathbf{x}}{2}{}
    =(3+2i)[cos(4t)+i\operatorname{sin}(4t)]\mp@subsup{\mathbf{x}}{1}{}+(3-2i)[\operatorname{cos}(4t)-i\operatorname{sin}(4t)]\mp@subsup{\mathbf{x}}{2}{}
    =(3+2i)[cos(4t)+i\operatorname{sin}(4t)][\begin{array}{l}{i}\\{2}\end{array}]+(3-2i)[\operatorname{cos}(4t)-i\operatorname{sin}(4t)][\begin{array}{l}{i}\\{2}\end{array}]
    = .
    =[ [-4\operatorname{cos}(4t)-6\operatorname{sin}(4t)
```

Course Notes 6.3: Systems of Linear Differential Equations
000000000000000
Complex Eigenvalues: Closer Look
Notes

Suppose $\lambda_{1}=\overline{\lambda_{2}}$ and $\mathbf{x}_{1}=\overline{\mathbf{x}_{2}}$.

Then $e^{\lambda_{1} t} \mathbf{x}_{\mathbf{1}}=\overline{e^{\lambda_{2} t} \mathbf{x}_{2}}$

$$
\begin{aligned}
c_{1} e^{\lambda_{1} t} \mathbf{x}_{1}+c_{2} e^{\lambda_{2} t} \mathbf{x}_{2} & =c_{1}(f+g i)+c_{2}(f-g i) \\
& =\left(c_{1}+c_{2}\right) f+i\left(c_{1}-c_{2}\right) g \\
& =a f+b g \\
& =a \cdot \operatorname{Re}\left(e^{\lambda_{1} t} \mathbf{x}_{1}\right)+b \cdot \operatorname{Im}\left(e^{\lambda_{1} t} \mathbf{x}_{1}\right)
\end{aligned}
$$

where $a$ and $b$ are arbitrary constants

## Course Notes 6.3: Systems of Linear Differential Equations

Complex Eigenvalues: Closer Look

$$
\mathbf{y}^{\prime}(t)=\left[\begin{array}{cc}
0 & -2 \\
8 & 0
\end{array}\right] \mathbf{y}(t) \quad \mathbf{y}(0)=\left[\begin{array}{c}
-4 \\
12
\end{array}\right]
$$

## Course Notes 6.3: Systems of Linear Differential Equations

Shorcut

Suppose we're solving $\mathbf{y}^{\prime}=A \mathbf{y}$, and $A$ has a complex pair of eigenvalues and eigenvectors $\lambda_{1}=\lambda_{2}, \mathbf{x}_{1}=\overline{\mathbf{x}_{2}}$.

To find the solutions corresponding to these eigenvalues and eigenvectors, $c_{1} e^{\lambda_{1} t} \mathbf{x}_{1}+c_{2} e^{\lambda_{2} t} \mathbf{x}_{2}$ is equivalent to
$a \cdot \operatorname{Re}\left(e^{\lambda_{1} t} \mathbf{x}_{1}\right)+\boldsymbol{b} \cdot \operatorname{Im}\left(e^{\lambda_{1} t} \mathbf{x}_{1}\right)$.
That is:

1. Choose a single solution, like $e^{\lambda_{1} t} x_{1}$
2. Separate it into its real and imaginary part
3. The general solution is any linear combination of the real and maginary part
