Outline

Week 7: Rotations, projections and reflections in 2D; matrix representation and composition of linear transformations; random walks; transpose.

Course Notes: 4.2, 4.3, 4.4

Goals: Understand that a linear transformation of a vector can always be achieved by matrix multiplication; use specific examples of linear transformations.

## $\begin{array}{lll}\text { Course Notes 4.2: Linear Transformations and Matrices } & \text { 4.3: Application: Random Walks } \\ \text { 00000000000000000000 } & \text { 4.3: The Transpose } \\ 0.00000\end{array}$ <br> Projections

For a fixed vector $\mathbf{a}$ in $\mathbb{R}^{2}$, let $T(\mathbf{x})=\operatorname{proj}_{\mathbf{a}} \mathbf{x}$

|  |  |
| :---: | :---: |

Computing Projections
Let $\mathbf{a}=\left[a_{1}, a_{2}\right]$ and $\mathbf{x}=\left[x_{1}, x_{2}\right]$.

$$
\operatorname{proj}_{\mathbf{a}} \mathbf{x}=\frac{1}{a_{1}^{2}+a_{2}^{2}}\left[\begin{array}{cc}
a_{1}^{2} & a_{1} a_{2} \\
a_{1} a_{2} & a_{2}^{2}
\end{array}\right]\left[\begin{array}{l}
x_{1} \\
x_{2}
\end{array}\right]
$$

Since $T(\mathbf{x})=\operatorname{proj}_{\mathbf{a}} \mathbf{x}=A \mathbf{x}$ for a matrix $A$, then $T$ is a linear transformation.

Let $\mathbf{a}=[1,1]$ and $\mathbf{x}=[2,3]$. Calculate $\operatorname{proj}_{\mathbf{a}} \mathbf{x}$ two ways.

$$
T(\mathbf{x})=\operatorname{proj}_{\mathbf{b}}\left(\operatorname{proj}_{\mathbf{a}}^{\mathbf{x}} \mathbf{x}\right)
$$

Is the projection of a projection a projection?
(Is there a vector $\mathbf{c}$ so that $T(\mathbf{x})=$ proj $_{\mathbf{c}} \mathbf{x}$ ?)
Example: $\mathbf{a}=\left[\begin{array}{l}1 \\ 2\end{array}\right], \mathbf{b}=\left[\begin{array}{l}1 \\ 5\end{array}\right]$

Reflections

For a fixed vector $\mathbf{a}$, let $\operatorname{Ref}(\mathbf{x})$ be the reflection of $\mathbf{x}$ across the line through the origin in the direction of a

## Notes

$\qquad$
Projections:

$$
\operatorname{proj}_{\mathbf{a}} \mathbf{x}=\frac{1}{a_{1}^{2}+a_{2}^{2}}\left[\begin{array}{cc}
a_{1}^{2} & a_{1} a_{2} \\
a_{1} a_{2} & a_{2}^{2}
\end{array}\right]\left[\begin{array}{l}
x_{1} \\
x_{2}
\end{array}\right]
$$

Identity:

$$
\begin{aligned}
& {\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right]\left[\begin{array}{l}
x_{1} \\
x_{2}
\end{array}\right]=\left[\begin{array}{l}
x_{1} \\
x_{2}
\end{array}\right] } \\
\operatorname{Ref}(\mathbf{x}) & =2 p r o j_{\mathbf{a}} \mathbf{x}-\mathbf{x} \\
& =\left[\begin{array}{cc}
\frac{2 a_{1}^{2}}{a_{1}^{2}+a_{2}^{2}}-1 & \frac{2 a_{1} a_{2}}{a_{1}^{2}+a_{2}^{2}} \\
\frac{2 a a_{2}}{a_{1}^{2}+a_{2}^{2}} & \frac{22_{2}^{2}}{a_{1}^{2}+a_{2}^{2}}-1
\end{array}\right]\left[\begin{array}{l}
x_{1} \\
x_{2}
\end{array}\right]
\end{aligned}
$$

$$
\operatorname{Ref}(\mathbf{x})=\left[\begin{array}{cc}
\frac{2 a_{1}^{2}}{a_{1}^{2}+a_{2}^{2}}-1 & \frac{2 a_{1} a_{2}}{a_{1}^{2}+a_{2}^{2}} \\
\frac{2 a_{1} a_{2}}{a_{1}^{2}+a_{2}^{2}} & \frac{22 a_{2}^{2}}{a_{1}^{2}+a_{2}^{2}}-1
\end{array}\right]\left[\begin{array}{l}
x_{1} \\
x_{2}
\end{array}\right]
$$

If $\mathbf{a}$ is a unit vector, then $a_{1}^{2}+a_{2}^{2}=1$. Then:

$$
\operatorname{Ref}(x)=
$$

And if a makes angle $\theta$ with the $x$-axis, then $a_{1}=\cos \theta$ and $a_{2}=\sin \theta$, so:

$$
\operatorname{Ref}_{\theta}(\mathbf{x})=
$$

$\cos ^{2} \theta=\frac{1+\cos 2 \theta}{2}$

$$
\sin ^{2} \theta=\frac{1-\cos 2 \theta}{2}
$$

## Notes

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

Reflections and Rotations

Compare:

$$
\begin{aligned}
\operatorname{Ref}_{\theta}(\mathbf{x}) & =\left[\begin{array}{cc}
\cos (2 \theta) & \sin (2 \theta) \\
\sin (2 \theta) & -\cos (2 \theta)
\end{array}\right]\left[\begin{array}{l}
x_{1} \\
x_{2}
\end{array}\right] \\
\operatorname{Rot}_{\phi}(\mathbf{x}) & =\left[\begin{array}{cc}
\cos \phi & -\sin \phi \\
\sin \phi & \cos \phi
\end{array}\right]\left[\begin{array}{l}
x_{1} \\
x_{2}
\end{array}\right]
\end{aligned}
$$

$\begin{array}{lll}\text { Course Notes 4.2: Linear Transformations and Matrices } & \begin{array}{l}\text { 4.3: Application: Random Walks } \\ \text { 000000 } \\ \text { 0000000000000 }\end{array} & \begin{array}{l}\text { 4.3: The Transpose } \\ \text { 00000 }\end{array}\end{array}$
Reflections

To reflect $\mathbf{x}$ across the line through the origin that makes angle $\theta$ with the $x$-axis:

$$
\operatorname{Ref}_{\theta}(\mathbf{x})=\left[\begin{array}{cc}
\cos (2 \theta) & \sin (2 \theta) \\
\sin (2 \theta) & -\cos (2 \theta)
\end{array}\right]\left[\begin{array}{l}
x_{1} \\
x_{2}
\end{array}\right]
$$

Example: find the reflection of the vector [2, 4] across the line through the origin that makes an angle of 15 degrees $(\pi / 12$ radians) with the $x$-axis.
What happens when we do two reflections?

## Course Notes 4.2. Linear Transformations and Matrices

Two Reflections gives a Rotation
Consider:

- Reflect across a line making an angle of $15^{\circ}$ with the $x$-axis, then
- reflect across a line making an angle of $135^{\circ}$ with the $x$-axis

Reflections

To reflect $\mathbf{x}$ across the line through the origin that makes angle $\theta$ with the $x$-axis:

$$
\operatorname{Ref}_{\theta}(\mathbf{x})=\left[\begin{array}{cc}
\cos (2 \theta) & \sin (2 \theta) \\
\sin (2 \theta) & -\cos (2 \theta)
\end{array}\right]\left[\begin{array}{l}
x_{1} \\
x_{2}
\end{array}\right]
$$

What happens when we do two reflections?

$$
\begin{aligned}
& {\left[\begin{array}{cc}
\cos (2 \theta) & \sin (2 \theta) \\
\sin (2 \theta) & -\cos (2 \theta)
\end{array}\right]\left[\begin{array}{cc}
\cos (2 \phi) & \sin (2 \phi) \\
\sin (2 \phi) & -\cos (2 \phi)
\end{array}\right] } \\
= & {\left[\begin{array}{cc}
\cos (2 \theta) \cos (2 \phi)+\sin (2 \theta) \sin (2 \phi) & \cos (2 \theta) \sin (2 \phi)-\sin (2 \theta) \cos (2 \phi) \\
\sin (2 \theta) \cos (2 \phi)-\cos (2 \theta) \sin (2 \phi) & \sin (2 \theta) \sin (2 \phi)+\cos (2 \theta) \cos (2 \phi)
\end{array}\right] } \\
= & {\left[\begin{array}{cc}
\cos (2(\theta-\phi)) & -\sin (2(\theta-\phi)) \\
\sin (2(\theta-\phi)) & \cos (2(\theta-\phi))
\end{array}\right]=\operatorname{Rot}_{2(\theta-\phi)} }
\end{aligned}
$$

Are reflections commutative?
Are reflections commutative with rotations?

##  <br> Reflections and Rotations

Are reflections commutative with rotations?

Try the following with a cell phone or book:

1. Rotate 90 degrees clockwise
2. Flip 180 degrees vertically

Alternately:

1. Flip 180 degrees vertically
2. Rotate 90 degrees clockwise

Notes

Suppose a linear transformation $T$ from $\mathbb{R}^{3}$ to $\mathbb{R}^{2}$ satisfies the following:
$T\left(\left[\begin{array}{l}1 \\ 0 \\ 0\end{array}\right]\right)=\left[\begin{array}{l}2 \\ 5\end{array}\right] \quad T\left(\left[\begin{array}{l}0 \\ 1 \\ 0\end{array}\right]\right)=\left[\begin{array}{l}0 \\ 1\end{array}\right] \quad T\left(\left[\begin{array}{l}0 \\ 0 \\ 1\end{array}\right]\right)=\left[\begin{array}{c}3 \\ -2\end{array}\right]$

Then $T(\mathbf{x})=A \mathbf{x}$ for the matrix $A=$

```
Course Notes 4.2: Linear Transformations and Matrices 4.3: Application: Random Walks 4.3: The Transpose

Which transformations are equivalent to matrix multiplication?

Theorem
Every linear transformation \(T\) that takes a vector as an input, and gives a vector as an output, is equivalent to a matrix multiplication.

Extended Theorem
Suppose \(T\) is a linear transformation that transforms vectors of \(\mathbb{R}^{n}\) into vectors of \(\mathbb{R}^{m}\). If \(e_{1}, \ldots, e_{n}\) is the standard basis of \(\mathbb{R}^{n}\), then:
\[
T\left(\left[\begin{array}{c}
x_{1} \\
x_{2} \\
\vdots \\
x_{n}
\end{array}\right]\right)=\left[\begin{array}{cccc}
\mid & \mid & & \mid \\
T\left(e_{1}\right) & T\left(e_{2}\right) & \cdots & T\left(e_{n}\right) \\
\mid & \mid & & \mid
\end{array}\right]\left[\begin{array}{c}
x_{1} \\
x_{2} \\
\vdots \\
x_{n}
\end{array}\right]
\]
\(\qquad\)
\(\qquad\)

That is: \(e_{1}=[1,0, \ldots, 0], e_{2}=[0,1,0, \ldots, 0]\), etc.

\section*{Course Notes 4.2: Linear Transformations and Matrices 4.3: Application: Random Walks 4.3: The Transpose ०00000000000000 00000 0000000000}

Geometric interpretation of an \(n\)-by- \(m\) matrix
linear transformation from \(\mathbb{R}^{m}\) to \(\mathbb{R}^{n}\).
Every matrix can be viewed as a linear transformation, and every linear transformation between \(\mathbb{R}^{n}\) and \(\mathbb{R}^{m}\) can be viewed as a matrix.

Notes

A matrix can be viewed as a particular kind of function.
\begin{tabular}{|c|c|c|}

\section*{Notes}

You are learning to walk on a tight rope, but you are not very good yet. With every step you take, your chances of falling to the right are \(1 \%\), and your changes of falling to the left are \(5 \%\), because of an old math-related injury that causes you to lean left when you're scared. When you fall, you stay on the ground where you landed.

Where are you after 100 steps?

\section*{ \\ Random Walk Example: Error Messages}

Suppose you are using a buggy program. You start up without a problem.
- If you have never encountered an error message, your odds of encountering an error message with your next click are 0.01 .
- If you have already encountered exactly one error message, your odds of encountering a second on your next click are 0.05 .
- If you have encountered two error messages, the odds of encountering a third on your next click are 0.1.
- After the third error message, your next click is to uninstall the program, and never use it again.

Possible states: no errors; one error; two errors; three errors; uninstalled

With the ordering \(\left[\begin{array}{c}0 \text { errors } \\ 1 \\ 2 \text { error } \\ 3 \text { errors } \\ \text { uninrors } \\ \text { uninstalled }\end{array}\right], \quad \mathbf{x}_{0}=\left[\begin{array}{l}1 \\ 0 \\ 0 \\ 0 \\ 0\end{array}\right]\). Using Octave:
- \(\mathbf{x}_{10}=P^{10} \mathbf{x}_{0} \approx\left[\begin{array}{l}0.904 \\ 0.076 \\ 0.15 \\ 0.015 \\ 0.003\end{array}\right]\)
- \(\mathbf{x}_{20}=P^{20} \mathbf{x}_{0} \approx\left[\begin{array}{c}0.818 \\ 0.115 \\ 0.0037 \\ 0.004 \\ 0.026\end{array}\right]\)
- \(\mathbf{x}_{100}=P^{100} \mathbf{x}_{0} \approx\left[\begin{array}{c}0.366 \\ 0.090 \\ 0.049 \\ 0.005 \\ 0.490\end{array}\right]\)
- \(\mathbf{x}_{200}=P^{200} \mathbf{x}_{0} \approx\left[\begin{array}{c}0.134 \\ 0.033 \\ 0.002 \\ 0.812 \\ 0.812\end{array}\right]\)
- \(\lim _{n \rightarrow \infty} \mathbf{x}_{n}=\left[\begin{array}{l}0 \\ 0 \\ 0 \\ 0 \\ 1\end{array}\right]\) (we'll do these computations more generally once we learn about eigenvalues!)

\section*{ \\ Harder Questions involving Random Walks}
- For which value of \(n\) does \(x_{n}\) have a certain characteristic?
- What is \(\lim _{n \rightarrow \infty} x_{n}\) ?

Note: \(\lim _{n \rightarrow \infty} x_{n}=\lim _{n \rightarrow \infty} P^{n} x_{0}\).
- Does \(\lim _{n \rightarrow \infty} x_{n}\) depend on \(x_{0}\) ?

Stay tuned for more Random Walks excitement

Transpose and Dot Product
\[
\mathbf{y} \cdot(A \mathbf{x})=\left(A^{T} \mathbf{y}\right) \cdot \mathbf{x}
\]
where \(A\) is an \(m\)-by- \(n\) matrix, \(\mathbf{x} \in \mathbb{R}^{n}\) and \(\mathbf{y} \in \mathbb{R}^{m}\).
\[
\begin{aligned}
& {\left[\begin{array}{l}
1 \\
2 \\
3
\end{array}\right] \cdot\left(\left[\begin{array}{cc}
1 & 0 \\
0 & 1 \\
-1 & 1
\end{array}\right]\left[\begin{array}{l}
8 \\
9
\end{array}\right]\right)=\left[\begin{array}{l}
1 \\
2 \\
3
\end{array}\right] \cdot\left[\begin{array}{l}
8 \\
9 \\
1
\end{array}\right]=8+18+3=29} \\
& \left(\left[\begin{array}{ccc}
1 & 0 & -1 \\
0 & 1 & 1
\end{array}\right]\left[\begin{array}{l}
1 \\
2 \\
3
\end{array}\right]\right) \cdot\left[\begin{array}{l}
8 \\
9
\end{array}\right]=\left[\begin{array}{c}
-2 \\
5
\end{array}\right] \cdot\left[\begin{array}{l}
8 \\
9
\end{array}\right]=-16+45=29
\end{aligned}
\]
