Instructor: Siamak Taati

Course description: We will begin by discussing the complex numbers and functions of a complex variable, then proceed to develop differential and integral calculus in this setting. The resulting theory is very beautiful and in many ways quite different from the "usual" calculus for functions of either one or several real variables. Complex analysis has many applications to science, engineering and other areas of mathematics.

We will go over (most of) chapters 1-6 in the text, covering the following topics: complex numbers, complex derivatives and analytic functions, elementary functions, contour integration, Cauchy's theorem, Cauchy's Integral Formula, Taylor series, Laurent series, singularities and residues.

The specific sections I plan to cover, subject to minor changes along the way, are 1.1-1.6, 2.1-2.6, 3.1-3.3, 3.5, 4.1-4.6, 5.1-5.6, 6.1-6.3.

Office Hours:
Tuesday 10:30-11:30, in 1105 Math Annex
Wednesday 2:30-3:30, in 1105 Math Annex
Thursdays 11-12, in LSK 300B
Fridays 11-12, in LSK 300B
