MATH 552 – Introduction to Dynamical Systems

Outline

2016W T1 (Sep–Dec 2016)

Ideas, methods and applications of dynamical systems and bifurcation theory: differential and difference equations, local bifurcations, perturbation methods, chaos. Prerequisite: two semesters of undergraduate differential equations.

Instructor: Wayne Nagata (e-mail: `nagata@math.ubc.ca`, tel: 604-822-2573)

Office: Mathematics 112, hours TBA

Web page: `http://www.math.ubc.ca/~nagata/m552/`

Textbook (optional, not required):

- Y. A. Kuznetsov, *Elements of Applied Bifurcation Theory,* Springer, New York (3rd ed. 2004).

Topics:

1. *Linear Dynamical Systems:* Linear vector fields and flows, linear maps, stable, unstable and centre subspaces, Floquet multipliers.
2. *Nonlinear Dynamical Systems:* Nonlinear vector fields and flows, nonlinear maps, Poincaré maps, linearization, hyperbolicity, stable and unstable manifolds, Hamiltonian systems, Lyapunov functions.
3. *Local Bifurcations:* Fold, Hopf and other local bifurcations, centre manifolds, normal forms.
4. *Global Dynamics:* Homoclinic bifurcations in the plane, Melnikov's method, chaos.
