You should have formed groups by now. Confirm the groups and outline your desired project topic to me. Some details expected. The rest of the assignment is to be done individually. I want you to select a paper (which can be one of those selected in assignment 3 if you wish) and use some keyword searches and the search engine MathSciNet (search the UBC library under Index and Databases for MathSciNet) to find at least two additional related (and new to you) articles. The search engine MathSciNet will allow you to specify a journal. I would restrict most of your attention to more elementary journals (the three you have been using) rather than a research article. As before, write three summaries of the papers and discuss how they might be combined into a write up. While I imagine the groups may start working together, these summaries should be done independently (no overlap inside a group).

The point of the assignment is for you to consider how a given interesting paper can be extended to a project by seeking out related papers. Email me for advice/chat about this and your projects. It is very easy to schedule a zoom meeting, perhaps with your entire group.
